PROJECT NAME	AUTO TICKET CLASSIFICATION USING FLOW DESIGNER
MAXIMUM MARKS	4 MARKS

Empathy Map Canvas: Auto Ticket Classification using Flow Designer

An Empathy Map Canvas helps to understand the mindset, thoughts, and actions of your customers (Students, Teachers, and IT Support Staff).

1. SAY & DO (What do they say and do?)

Say:

- "My Wi-Fi is not connecting, please fix it before the class starts!"
- "The projector is not working, it's taking too long."
- "Manually categorizing tickets takes too much time, the workload is very high."

Do:

- Send multiple support requests via email to the helpdesk.
- Check daily status updates to get their issues solved.
- IT staff manually open every single ticket to select and assign categories.

2. THINK (What are they thinking?)

- When will these IT helpdesk requests actually get resolved quickly?
- Why do we have to manually check every ticket each time?
- How great it would be if there was an automated system!
- They eagerly expect a prompt solution to their queries.

3. FEEL (What are they feeling emotionally?)

- Frustrated: Feeling annoyed when support requests get delayed.
- Overwhelmed: IT staff feel stressed and exhausted due to the heavy volume of daily tickets.
- Impatient: Students and teachers feel annoyed and fatigued due to lack of quick resolution.

4. PAINS (What are their barriers / pain points?)

- Time is wasted due to manual ticket categorization.
- Human errors can route tickets to the wrong categories.
- Status tracking is very slow.

5. GAINS (What are their goals / desired benefits?)

- Instant and automatic ticket classification (using Flow Designer).
- Correct routing of tickets to the right Category and Subcategory.
- Reduced helpdesk response time, making both users and IT staff happy and satisfied.
