Project Name	Auto Ticket Classification using Flow Designer
Maximum mark	2 marks

Problem Solution:

- In Auto Ticket Classification using Flow Designer, customer support teams receive a large number of support tickets every day. These tickets may be related to technical problems, billing issues, login problems, account issues, service requests, and other concerns.
- Usually, support staff need to manually read each ticket, understand the issue, identify its category and priority, and assign it to the correct department. When the number of tickets is high, this process can take more time and may result in incorrect assignment or delayed responses.
- Our proposed solution uses FLOW DESIGNER to automate this process. When a new ticket is received, the workflow processes the ticket details, identifies the appropriate category and priority, and routes the ticket to the relevant support team.
- Therefore, the Problem–Solution Fit shows the connection between the actual support problem and our automated solution.

Purpose:

- **To identify the real customer problem**
  Understand the difficulties faced by customers and support teams while handling tickets.
- **To identify the root cause**
  Find out why ticket classification and assignment can be slow or inaccurate.
- **To understand customer behaviour**
  Understand how customers submit tickets and how support teams currently process them.
- **To analyze existing solutions**
  Identify the methods currently used, such as manual classification and helpdesk systems.
- **To validate our proposed solution**
  Check whether the FLOW DESIGNER workflow effectively addresses the identified problem.
- **To improve customer satisfaction**
  Faster classification and correct routing can help support teams respond to tickets more efficiently.

Template:

No.	Template Section	Content for Our Project
1	Customer Segment (CS)	IT support teams, customer service teams, helpdesk teams, and organizations that receive and manage a large number of customer support tickets.

2	Jobs-to-be-Done / Problems (JBP)	Customers need to submit their problems and get their tickets classified, prioritized, and assigned to the correct support team quickly. Manual classification takes time and may cause incorrect assignment.
3	Triggers (TR)	The process starts when a customer submits a new support ticket about a technical issue, billing problem, login issue, account problem, service request, or complaint.
4	Emotions – Before / After (EM)	Before: Customers may feel frustrated due to delayed responses, while support staff may feel overloaded by repetitive ticket classification. After: Faster ticket processing, quicker responses, and reduced manual workload improve the overall support experience.
5	Available Solutions (AS)	Existing methods include manual ticket classification, email-based support, helpdesk systems, predefined rules, and manual department assignment. These methods may require significant human effort when ticket volume increases.
6	Customer Constraints (CC)	Major constraints include high ticket volume, limited support staff, limited processing time, incorrect ticket routing, multiple ticket categories, and difficulty identifying urgent tickets quickly.
7	Behaviour (BE)	Customers submit tickets through support channels and wait for a response. Support staff usually read the ticket, understand the issue, select the category and priority, and assign the ticket to the appropriate team.
8	Channels of Behaviour (CH)	Tickets can be received through web forms, customer portals, email, helpdesk applications, chatbots, and other online support channels.
9	Problem Root Cause (RC)	The main causes are manual classification, increasing ticket volume, lack of automated categorization, incorrect routing, and difficulty identifying ticket priority quickly.
10	Your Solution (SL)	Our solution uses FLOW DESIGNER to automate the ticket-handling process. It receives the ticket, processes its details, identifies the category and priority, and automatically routes the ticket to the appropriate support team.
