Project Design Phase

Proposed Solution

Date	28 September 2026
Team Id	6ab220cfbee0b08a2d2c63cd
Project Name	Auto Ticket Classification using Flow Designer
Maximum mark	2 Marks

Proposed Solution:

S.No.	Parameter	Description
1	**Problem Statement (Problem to be solved)**	Customer support teams receive a large number of tickets related to technical issues, billing, account problems, service requests, etc. Manually reading and classifying each ticket takes time and may cause incorrect assignment or delays.
2	**Idea / Solution description**	The proposed solution uses **Flow Designer** to automatically process incoming support tickets. The system analyzes the ticket details such as subject and description, identifies the issue category and priority, and automatically routes the ticket to the appropriate department or team.
3	**Novelty / Uniqueness**	The solution reduces manual ticket classification by using an automated workflow. It can classify tickets based on predefined categories, assign priority, and route them automatically. This provides a faster and more consistent support process.
4	**Social Impact / Customer Satisfaction**	Faster ticket classification and routing helps customers receive responses quickly. It reduces waiting time, avoids tickets being sent to the wrong team, and improves customer satisfaction. It also reduces repetitive work for support staff.
5	**Business Model (Revenue Model)**	The solution can be offered as a **subscription-based support automation service** for organizations. Revenue can be generated through monthly or yearly plans based on the number of tickets, users, or features. It can also be customized for individual businesses.
6	**Scalability of the Solution**	The solution can be scaled from small businesses to large organizations. New ticket categories, departments, rules, priorities, and workflows can be added as the organization grows. It can handle increasing numbers of support tickets through automated processing.
